Logic programming is a programming paradigm which is largely based on formal logic. Any program written in a logic programming language is a set of sentences in logical form, expressing facts and rules about some problem domain. Major logic

programming language families include Prolog, answer set programming (ASP) and Datalog. In all of these languages, rules are written in the form of clauses:

Answer set programming (ASP) is a method for solving hard problems using computational logic. We describe a problem as a set of formulas of a declarative logical language in such way that the solutions correspond to the models (answer sets) of the set and then use a general-purpose inference engine to find the answer sets.

Logic programming - Wikipedia programming algorithm obviously suggests to also employ sophisticated off-the-shelf ASP systems as internal machinery for evaluating the specified algorithm. Thus, our approach not only takes full advantage of the rich syntax ASP offers to describe the dynamic programming algorithm, but also delegates the burden of local
